

docs/install.md for @git.zone/tscoverage

Install npmts

Get started with TypeScript awesomeness.

“*npmts-g* checks if the global version of npmts suffices the modules requirements. If not it installs npmts locally in the right version during npm install.

```
npm install npmts -g # installs npmts globally  
npm install npmts-g --save-dev # installs npmts-g checking tool as devDependency
```

Then add it to your package.json's script section to trigger a build:

```
"scripts": {  
  "test": "(npmts)"  
}
```
